OS CASREACT 134:295413; MARPAT 134:295413

AB The preparation of a peracid, perester, or diacyl peroxide is achieved by the reaction of a mixed anhydride R1[C(O)OC(O)OR2]n or [R3C(O)OC(O)O]pR4 with a hydroperoxide R5[OOH]m in the presence of a base [R1 = mono-, di-, tri- or tetravalent (un)substituted C1-19 hydrocarbyl; n = 1-4; R2 = (un)substituted C1-20 hydrocarbonyl; R3 = (un)substituted C1-19 hydrocarby; R4 = di-, tri- or tetravalent (un)substituted C1-20 hydrocarbyl; p = 2-4; R5 = H, mono- or divalent (un)substituted C3-18 tertiary-alkyl, (un)substituted C2-20 acyl; m = 1, 2; if R5 = H, then m = 1] and provided that if the hydroperoxide is an α,α-dihydroperoxyperoxide, the reaction is not carried out in an inert two-phase solvent system comprising a polar solvent and an polar solvent. Thus, 6-hexanolactone was reacted with aqueous NaOH, N-methylmorpholine added, iso-Pr chloroformate added, and 70% aqueous H2O2 added, producing di(6-hydroxyhexanoyl) peroxide in 68% yield.

LA English

AB N-Acetylcysteamine and CoA esters of cis-2-alkenoic acids underwent isomerization to the corresponding trans-isomers during their preparation by the mixed anhydride method and also during their alkaline hydrolysis. The isomerization might proceed by interaction of the free SH group and the cis-double bond of 2-alkenoic thiol esters. The use of pyridine as a base and ≥3 equiv of the mixed anhydride to the thiol compound prevented the formation of the trans-isomer. Addition of H2O2 during alkaline hydrolysis also prevented the isomerization completely.

AB Peroxy acids are prepared by perhydrolysis with highly concentrated hydrogen peroxide of a mixed
anhydride of an appropriate carboxylic acid such as a diethyl phosphoric-carboxylic acid anhydride. Although perhydrolysis is usually effected by catalysis with methanesulfonic acid, catalysis was not required in at least one case. Both aliphatic and aromatic peroxy acids containing either electron-donating or electron-accepting groups can be prepared indicating that the process of the invention is general in scope and is utilizable with compounds having a broad range of carbon chain lengths. Yields of peroxy acids above 70% are easily obtained.

AB     Bleaching compositions are provided that comprise peracid
       activators. The peracid activators are ester derivatives of a
       carboxylic acid where the oxygen is covalently bound through a
       polyhydroxy linking group to a leaving group that is displaceable in a
       peroxygen bleaching solution by perhydroxide anion. When the
```

peracid activator is combined with a source of peroxygen in aqueous solution, then a stain removing peracid is formed. One embodiment of the peracid activator has the structure ##STR1## where R' is a branched or linear C.sub.4-12 alkyl, n is 1 to about 7, and L is a leaving group.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB Polyglycolate compounds are provided having the general structure: ##STR1## wherein n is an integer from 2 to about 10; R is C.sub.1-20 linear or branched alkyl, alkoxylated alkyl, cycloalkyl, aryl, alkylaryl, substituted aryl; R' and R" are independently H, C.sub.1-20 alkyl, aryl, C.sub.1-20 alkylaryl, substituted aryl, and NR.sub.3.sup.α+, wherein R.sup.α is C.sub.1-30 alkyl; and L is a leaving group displaceable in a peroxygen bleaching solution by perhydroxide anion. When this compound is combined with a source of peroxgen in aqueous solution, then a plurality of stain removing peracids are formed. Such peracids are formed substantially sequentially beginning with the carbonyl adjacent to the leaving group L. Thus, a first stain removing peracid having the structure ##STR2## will be formed in amounts approaching quantitative yield.
